Interview Protocol:

Interview for Healthcare Professionals:

Part 3: Reflection, Learning and Debriefing

1. Did these visualisations help you reflect on your teamwork and communication strategies in any way? If yes, how?
2. Did the visualisations reveal anything you hadn't learnt during the simulation itself? If yes: What did you learn?
3. Did the visualisations help to reflect on future actions or improvements in your practice? If yes, how?
4. Overall, how did this data-driven debrief compare to traditional discussion-based debriefings you've had before?
5. Did these visualisations make debrief and reflection feel more objective or more intimidating? Why or why not?
6. Did the visualisations make team dynamics visible, clearer or more confusing? Why or what not?
7. What concerns, if any, do you have about using data-driven analytics in your debriefing? Can you provide specific examples or situations?
8. Follow-up: Do you have any concerns on exposing your physiological data during debrief? Which concerns? How can we overcome these?
9. Do you have any concerns on using AI generated data?
10. What additional information or design changes would make the visualisations more useful for debriefing and reflection?

Interview for Debriefer:

Complete questionnaire

1. How useful was AI-powered analytics for helping you during the debrief? Can you give an example of something that helped you notice or understand teams' performance better?
2. Did the AI-generated analytics add value to your practice compared to the usual debriefing?
3. Did using AI-powered analytics feel like it could help you perform your educator and debriefer role more effectively, or be recognized for your contribution?
4. Would you see any professional benefit in using such analytics regularly? Would this motivate you to use it again?
5. How well did visualisations fit with what you normally do in in-situ simulations and debrief? For example, features like tagging during the scenario, access to the visualizations, sharing visualizations with the participants.
6. Did using the AI-powered analytics save you time, or add extra work?
7. What aspects felt most aligned, or at least aligned, or, with your workflow, or with the way you normally run debriefs?
8. Compared with doing debriefs without analytics, what advantages did the AI-powered analytics provide?
9. Did the analytics reveal insights you wouldn't normally have noticed?
10. Would you prefer this approach or traditional debriefing without data?
11. If AI-powered analytics become part of the regular simulation practice, what effects would you expect on team learning or performance? Would it improve the quality of feedback or teamwork reflection?

12. Do you think others would view you as more competent or data-driven for using it?
13. How easy or difficult was it to learn and use AI-powered analytics as part of your debrief practice? Which parts felt more intuitive or confusing?
14. How easy or difficult was it to interpret the AI-generated analytics without extra explanation?
15. Did the system ever feel too time-consuming or complicated to use in the movement? What aspects require the most effort?
16. What would make it more simpler for educators and debriefers to use during simulations?
17. Did anyone, like educators, supervisors, or peers, encourage or expect you to use AI-powered analytics?
18. Do you think using this kind of system changes how others see your professional skills or status? And if there is any perception, would that perception matter in your workplace?
19. Did you feel you had enough knowledge, resources, and support, and control to use AI-powered analytics effectively?
20. Were there times you wanted to do something but couldn't because of the system limits? Can you please provide some examples?
21. What extra support would help you feel more confident?
22. Overall, what's your general feeling about using technology like this in in-situ simulations or other simulations? Would you describe it as a good or bad idea for your context? And what made you think in that way?
23. Did you find using AI-powered analytics enjoyable or interesting in itself, beyond its usefulness? Did it make you curious to explore the data further?
24. How did using AI-powered analytics make you feel during or after the debrief? Did it make the debrief more engaging or more stressful? Were there moments of frustration or excitement?
25. When you think about future in-situ simulations or other simulations, would you like to see AI-generated analytics, integrated? And what makes you want or don't want to use it again?
26. What kinds of data or visualizations would be most valuable to you?
27. What other information would you like to have access to?
28. How much did you trust that the AI-generated analytics accurately represented what happened?
29. What made you confident or doubtful about their accuracy? Would trust change if you used it more often?
30. Did the AI analytics seem more accurate and objective compared to your own observations, and why?
31. Did the visualization match to what actually happened during the simulation?
32. Did they feel fair and unbiased, or did something seem off? In what ways can we improve this?
33. How easy or difficult was it to understand how the AI produced these analytics?
34. What kind of transparency would help you feel more confident?
35. Did the AI analytics make the debrief feel more objective or data-driven?
36. Did they reduce bias in how the team interpreted events, or just add another perspective?
37. Do you think data like this should complement or replace human judgment?

38. Were there any risks or concerns you noticed in relying on these analytics during the debrief? What might go wrong if the data were inaccurate?
39. How could the system build your confidence in future use?
40. What improvements would make this system more useful or easier to use in your simulations?
41. How could AI analytics best support reflection, teamwork, or patient care in the future?
